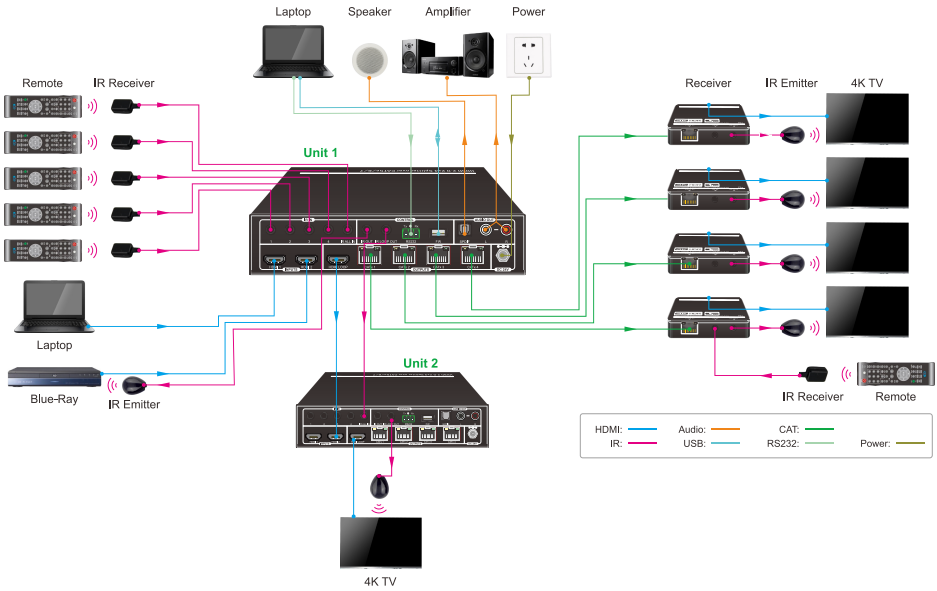
4. System Connection

4.1 Usage Precaution

- Make sure all components and accessories included before installation.
- System should be installed in a clean environment with proper temperature and humidity.
- All of the power switches, plugs, sockets, and power cords should be insulated and safe.
- All devices should be connected before power on.

4.2 System Diagram



5. Source Switching

1) Press the **SELECT** button to switch to next source device, and then the corresponding input LED will turn green.

2) Press and hold the **SELECT** button at least 3 seconds to enable auto switching mode, and it abides by the following principles:

- *The switcher will switch to the first available active input starting at HDMI IN 1> HDMI IN 2.*
- *New input: Once a new input signal detected, the switcher will automatically switch to this new signal.*
- *Source removed: When an active source is removed, the switcher will switch to the first available active input starting at HDMI IN 1.*
- *Reboot: The switcher can save the last configuration before losing power. If the last switching mode is auto switching, the switcher will automatically enter auto switching mode once rebooted, then detect all inputs and memorize their connection status for future rebooting using. If the last selected input source is still available, the switcher will switch to this input. Otherwise, it will switch to the first available active input source starting at HDMI IN 1.*
- *Exit auto switching mode: Press and hold the **SELECT** button for 3 seconds again to exit the auto mode, and the input source will not be changed.*

6. Video Resolution Down-scaling

The product supports video resolution down-scaling on 4 CAT outputs, the 4K input can be automatically degraded to 1080p output for compatibility with 1080p display, shown in the below chart.

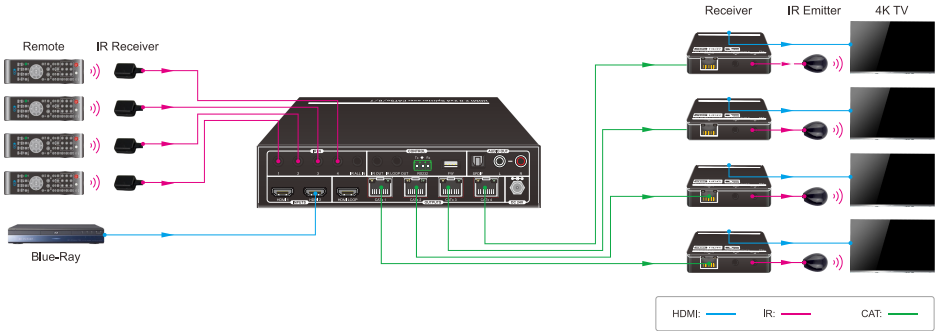
7. IR Control

The IR receivers and emitters can be connected to the system to allow for IR control of remote devices. The bidirectional IR feature provides the two-way control either for the source or display device(s). Use the following sample connection diagrams to connect for IR remote control.

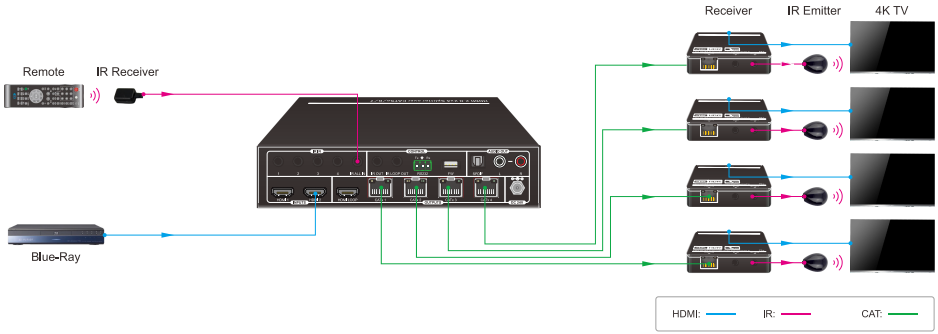
7.1 Controlling the Display Device by IR IN

The four **IR IN** ports of the splitter can receive IR signals from remotes to send to control displays. Connect four IR receiver to **IR IN** ports of the splitter, and then connect four IR emitters to **IR OUT** ports on receivers.



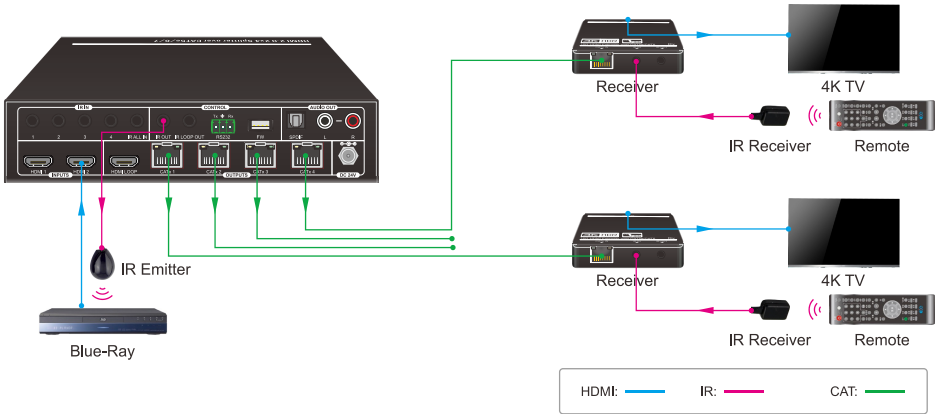
7.2 Controlling the Display Device by IR ALL IN

The **IR ALL IN** port of the splitter can receive all IR signals from remotes to send to control displays. Connect an IR receiver to **IR ALL IN** port of the splitter, and then connect four IR emitters to **IR OUT** port on receivers.



7.3 Controlling the Source Device

The **IR OUT** port of the splitter can send all IR signals to control source device. Connect four IR receivers to **IR IN** ports on receivers, and then connect an IR emitter to **IR OUT** port of the splitter.



8. RS232 Control

The splitter and compatible receivers features RS232 ports to transmit RS232 signals from computer to control far-end third-party devices by using 3-pin to DB9 cable and a RS232 control software, such as **docklight**. After installing the RS232 control software, please set the parameters of COM number, bound rate, data bit, stop bit and the parity bit correctly. Compatible receivers must be able to communicate at 9600, 19200, 38400, 57600, or 115200 baud. The splitter requires the following communication protocol parameters:

Baud rate: 9600 (default)

Data bit: 8

Stop bit: 1

Parity bit: none

Note:

- *All commands need to be ended with "<CR><LF>".*
- *In the commands, "[" and "]" are not needed to be typed in actual operation.*
- *Type the command carefully, it is case-sensitive.*

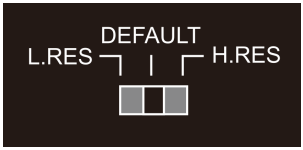
9. EDID Management

The Extended Display Identification Data (EDID) is used by the source device to match its video resolution with the connected display. By default, the source device obtains its EDID from the first connected display. Meanwhile, since the displays with different capabilities are connected to the splitter, the 3-pin DIP switch on the front panel can be used to set the EDID to a fixed value to ensure the compatibility in video resolution.



Switch Status	Description
L.RES	The splitter reads all EDID information from all connected displays, and choose the one with lowest resolution passing to the source.
DEFAULT	3840x2160@60Hz Deep Color Stereo Audio
H.RES	The splitter reads all EDID information from all connected displays, and choose the one with highest resolution passing to the source.

10. Firmware Upgrade

Please follow the below steps to upgrade firmware by the USB-A port:

1) Prepare the latest upgrade file (.bin) and rename it as “FW_MERG.bin” on PC.
2) Power off the splitter and connect the Micro-USB (FIRMWARE) port of splitter to the PC with USB cable.
3) Power on the splitter, and then the PC will automatically detect a U-disk named of “BOOTDISK”.
4) Double-click to open the U-disk, a file named of “READY.TXT” will be showed.
5) Directly copy the latest upgrade file (.bin) to the “BOOTDISK” U-disk.
6) Reopen the U-disk to check whether there is a filename “SUCCESS.TXT”, if yes, the firmware was updated successfully, otherwise, the firmware updating is fail, the name of upgrade file (.bin) should be confirmed again, and then follow the above steps to update again.
7) Remove the USB cable and reboot the splitter after firmware upgrade.
